

Multi-factor authentication on critical systems — My Cash Pilot

AHN Media · screenshots taken 16 September 2026

Every system that stores or processes financial data requires a second factor at sign-in. The factor in use is a time-based one-time password from an authenticator app; Vercel additionally has a passkey registered.

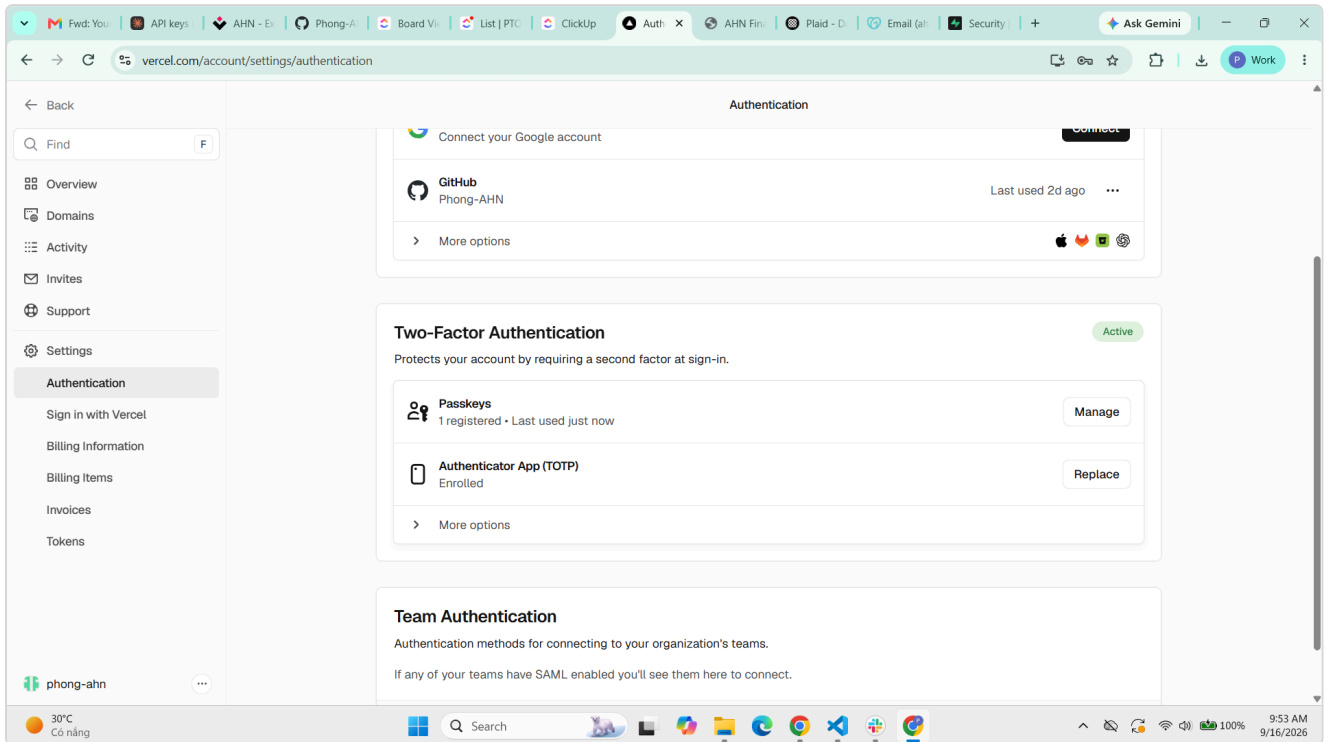

1. Supabase — the database holding all financial data

Account → Security. Multi-factor authentication is enrolled with an authenticator app (TOTP). This is the system of record for every bank transaction and balance the application stores.

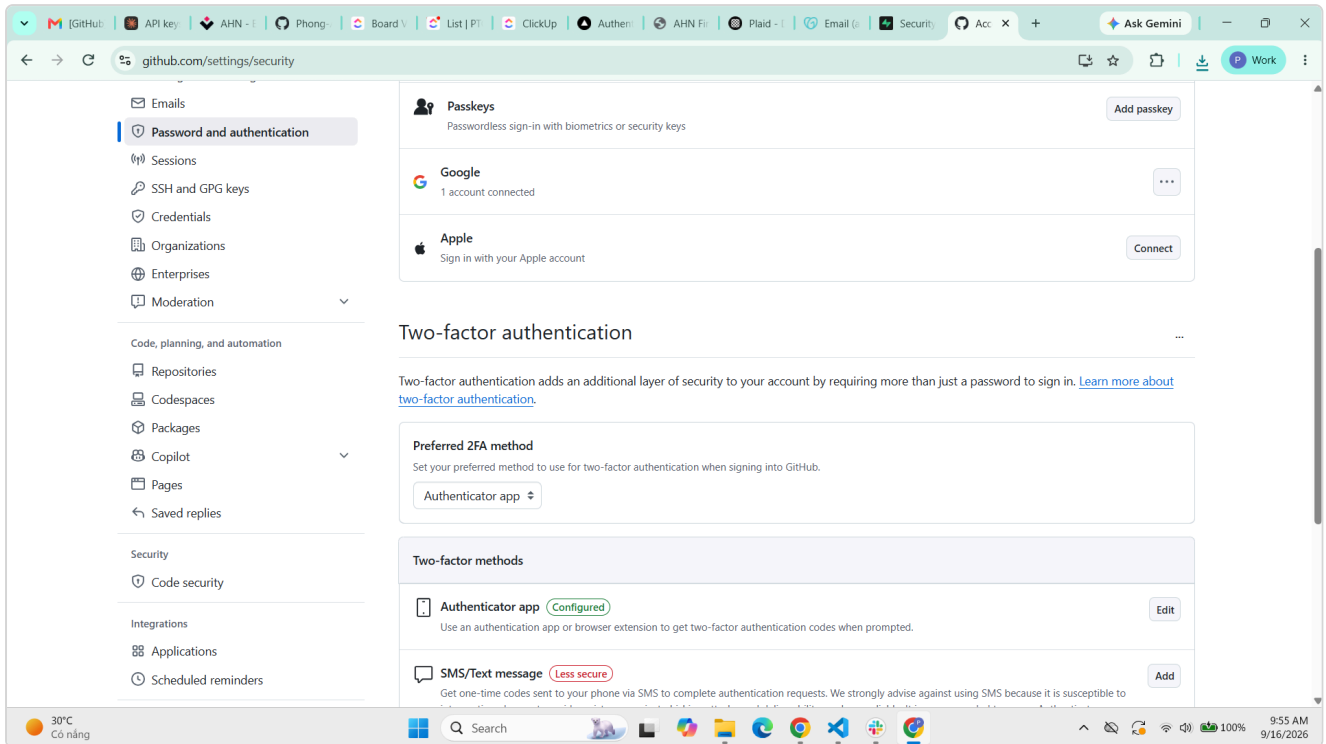

2. Vercel — hosting, and the store for every secret

Account Settings → Authentication. Two-factor authentication is Active, with a passkey registered and an authenticator app enrolled. Vercel holds the environment variables containing the Plaid credentials and the key used to encrypt provider tokens.

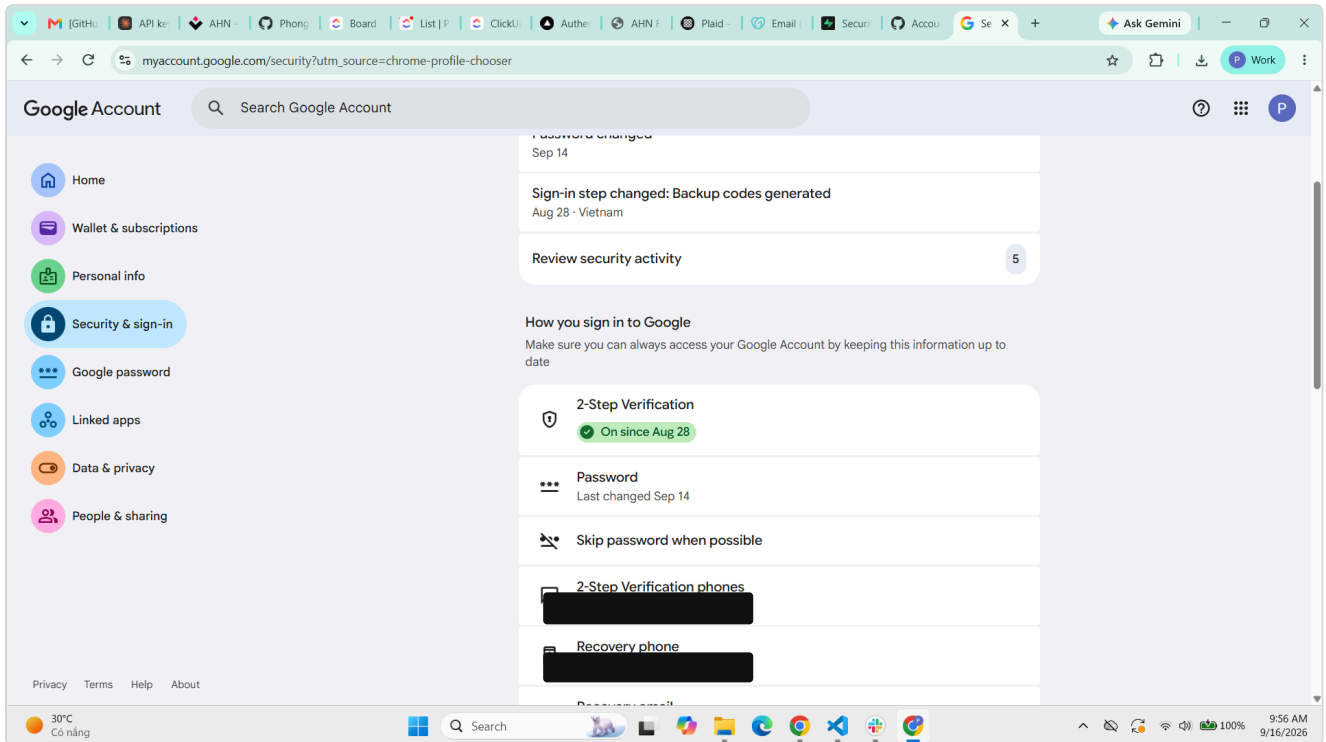

3. GitHub — source control for the application

Settings → Password and authentication. Two-factor authentication is configured with an authenticator app as the preferred method. Anyone able to change this code could change what runs in production.

4. Administrative email account

Google Account → Security. 2-Step Verification has been on since 28 August 2026. Password recovery for the systems above passes through this mailbox, which makes it a critical system in its own right. Phone numbers have been redacted in this copy.

5. Slack — the workspace receiving financial alerts

Account → Settings. Two-Factor Authentication is Active. Alerts about unusual financial activity are delivered to this workspace.
